fast Walsh transform to a threshold value; and replacing each magnitude of said stored result of performing said first fast Walsh transform that is greater than said threshold value with a zero to obtain a first modified result (emphasis added).

Prior art also does not teach a receiver device, comprising combined elements of a despreader, a carrier phase recovery module, a fast Walsh transform module, a comparator operable to compare each value output from said fast Walsh transform module to a threshold; a first memory register operable to store element values output from said comparator as having a value less than said threshold; and a second memory register operable to store element values output from said comparator as having a value not less than said threshold.
